Mixing Made Easy by Richard Hanson

ez , safe, mixing

Call up a new unused default model - name it MYTEST

Locate your Monitor screen

Note how each stick /switch movement moves the curser up/down.

write down each one which you can make move.

This can be modified all you like - and later deleted. it affects nothing on any other model.

Now go to aircraft type and look at the various wing /tail types. These are mixed functions- ready to use!

Select dual ailerons; Now watch the Monitor screen again - note the aileron stick causes two cursers to move together.

Go back to Aircraft type - - select single aileron and add a different combination say Vtail or dual elevator.

Go back to Monitor and watch which cursers move as you move the sticks. Try different preprogrammed mixes and notice they will cause various cursers in the Monitor to move. Write these down- just to see how the preprogrammed mixes select various additional channels.

This procedure will also show you what each mix YOU make, is actually doing.

Try doing some mixes and see how they work in the Monitor.
